US-11-10/028-34

Sequence 34, Application US/11107028

Publication No. US20050276803A1

GENERAL INPORMATION:
APPLICANT: CHAN, ANDEW C.
APPLICANT: GONG, QIAN
TITLE OF INVENTION: Method for Augmenting B Cell Depletion
FILE REFERENCE: P2112X1

CURRENT APPLICATION NUMBER: US/11/107,028

CURRENT FILING DATE: 2005-04-15

PRIOR PILING DATE: 2004-04-16

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 33, R

```
The present invention describes an isolated antibody, or an antigen-
binding antibody fragment (1), that preferentially binds cell-associated
CC Aliz5/0772 polypeptide relative to shed CA 125/0772 polypeptide. Also
CC Aliz5/0772 polypeptide relative to shed CA 125/0772 polypeptide. Also
CC amonoclonal antibody that competes with binding of (II); (3) a hybridoma
CC amonoclonal antibody that competes with binding of (II); (3) a hybridoma
CC amonoclonal antibody that composition comprising an antibody or an
antigen-binding ancibody fragment that preferentially binds cell-
associated CA 125/0772P polypeptide relative to shed CA 125/0772P
CO pypeptide, and a carrier; (6) a pharmaceutical composition comprising
CC (II); (5) a pharmaceutical composition comprising
CC antiported, and a carrier; (6) a pharmaceutical composition comprising
CD polypeptide, and a carrier; (7) an article
CM monoclonal antibody, or an antigen-binding material and a composition
CC comprising an antibody, or an antigen-binding material and a composition
CC comprising an antibody, or an antigen-binding material, and
CC composition in a form suitable for administration to a subject; (8) a
CC composition in a form suitable for administration to a subject; (8) a
CC composition in a form suitable for administration to a subject; (8) a
CC suitabody fragment, which preferentially binds cell-associated CA
CC composition in a form suitable for administration to a subject; (8) a
CC antibody fragment, which preferentially binds cell-associated CA
CC composition in a form suitable for administration to a subject; (8) a
CC antibody fragment, which preferentially binds cell-associated CA
CC angent; (9) ampliorating (M1) a symptom of a CA 125/0772P-related disorder
CC (10) a monoclonal antibody (V1) bosen from 325.1, 621.1, 633.1, 654.1,
CC (10) a monoclonal antibody (V1) bosen from 325.1, 621.1, 619,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated antibody, or antigen-binding antibody fragment binding with cell-associated CA 125/0772P polypeptide relative to shed CA 125/0772 polypeptide, useful for ameliorating cervical or ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                  antibody; antigen-binding antibody fragment; cell-associated CA 125/0772P; monoclonal antibody; cytostatic; mimunostimulant; mediator of lysis; tumour; cell proliferative disorder; cancer; cervical cancer; uterine cancer; breast cancer; lung cancer; ovarian cancer.

antibody fragment; (11) an antibody or antigen binding antibody fragment that competes with (11), and (12) a pharmaceutical composition comprising (VI) and a carrier. (11) has cytostatic activity, and can be used as an immunostimulant and a mediator of lysis of positive tumour cell. (1) is useful for ameliorating a symptom of a CA 125/O7P-related disorder which is a cell proliferative disorder such as cancer, cervical or uterine cancer, breast or lung cancer or ovarian cancer. (V) is useful diagnostically for monitoring the development or progression of cancer or tumour as part of clinical testing procedure. The present sequence represents an antibody light chain variable region amino acid sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                ö

                                                                                                                                                     This sequence is from the light chain variable region of an anti-IL2R alpha monoclonal antibody. The antibody is only weakly inhibitory on its own. When anti-IL2R alpha antibodies which are strongly inhibitory on their own are used with anti-CD4 antibodies which are also strongly inhibitory, their immunosuppressive properties are improved; they synergistically inhibit T-helper cell proliferation to effectively inhibit transplant rejection at low doses without significantly reducing the general immune response. No such synergistic effect is observed with the weakly inhibitory MAD M-215. See AAQ36607-Q36616. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN

                                                                                                                                  The sequence is that of the interleukin-2 (IL-2) chimeric antibody light chain, coded by clone 215. Antibodies against IL-2 receptors are useful as immunosuppressants, and are much less immunosuppressants are useful antibodies. See also ARM15221-RM3256. (Updated on 25-MAR-2003 to correct PI field.)                                                                                                                                                                                                                                         ö
                                                                                                                     The present invention relates to a chimeric protein having a Flt3 ligand (FL) or its biologically active fragment and a proteinuous or peptidyl tumoricidal agent. The invention is useful for treating malignancy, neoplasm e.g. melanoma, breast cancer, hepatocellular carcinoma and as a vaccine for eliciting an immune response. The invention is also useful in gene therapy. The present sequence is the 2B8 light chain variable region

                                                                                                                                                                                                               This invention relates to a novel chimeric protein comprising an Flt3 ligand, or its biological fragment, and a proteinuous or peptidyl tumoricidal agent. The invention may be useful for the production of compounds with a cytostatic activity or a vaccine. The composition and methods are useful for preventing or treating neoplastic conditions, such as melanoma, breast cancer or hepatocellular carcinoma. The present sequence is that of a protein which is related to the chimeric proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibody engineering; chimeric antibody; cytostatic; gene therapy; vaccine; gastrointestinal disease; immune response; melanoma; malignancy; breast cancer; hepatocellular carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                            The present invention relates to a chimeric protein having a Flt3 ligand (FL) or its biologically active fragment and a proteinuous or peptidyl tumoricidal agent. The invention is useful for treating malignancy, neoplasm e.g. melanoma, breast cancer, hepatocellular carcinoma and as a vaccine for eliciting an immune response. The invention is also useful in gene therapy. The present sequence is the anti-CD20 chimeric antibody

This invention relates to a novel chimeric protein comprising an Flt3 ligand, or its biological fragment, and a proteinuous or peptidyl tumoricidal agent. The invention may be useful for the production of compounds with a cytostatic activity or a vaccine. The composition and methods are useful for preventing or treating neoplastic conditions, as melanoma, breast cancer or hepatocellular carcinoma. The present

                                                                                                                                                                                                                                                                                                                                 remodeling, glycoconjugation; glycosyltransferase; glycan; CD20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a cell-free, in vitro method of remodeling a peptide. The method involves removing a saccharyl subunit from the peptide, thus forming a truncated glycan, and contacting the truncated glycan with at least one glycosyltransferase and at least one glycosyl donor under conditions suitable to transfer at least one glycosyl donor

to the truncated glycan, thus remodeling the peptide. Conjugates can be formed between a granulocyte colony stimulating factor (G-CSF) peptide, interferon alpha peptide, interferon beta peptide, erythropoietin. Cactor IX peptide, follicle stimulating hormone peptide, erythropoietin (EPO) peptide, granulocyte macrophage colony stimulating factor (GM-CSF) peptide, interferon-gamma peptide, tabbal-protease inhibitor (A-IP) peptide, interferon-gamma peptide, issue plasminogen activator (TPA) peptide, interleukin-2 (IL-2) peptide, tissue plasminogen activator (TPA) peptide, interleukin-2 (IL-2) peptide, factor VIII peptide, TNFalpha receptor/immunoglobulin (Ig) G fusion peptide, urokinase peptide, anti-coptortein ID/III monoclonal antibody peptide, chimeric anti-HER2 altibody peptide, anti-respiratory syncytial virus (RSV) F peptide, anti-copi antibody peptide, enti-respiratory syncytial virus (RSV) F peptide, anti-nosulinate B surface antigen (Hbasg), human growth hormone (HGH) peptide, and a modifying group, where the modifying group is covalently attached to the peptide through an intact glycosyl linking group. The method is useful for a cell-free, in vitro method of remodeling the above mentioned peptides. The present sequence represents the murine anti-CD20 antibody light chain mature variable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                        Treating B cell lymphoma in humans, comprises administering immunologically active, chimeric anti-CD20 antibodies and/or radiolabeled anti-CD20 antibodies to the human.
                                                                                                                                                                                                                                                                                                                                                                                PGSSPKPWIYGTSTLASGVPTRFSGSGTSYSLTISRVEAEDAATYYCQQWSSNPFTFG 120
                                                                                                                                                                                                                                                                                                                                        9
                                                                                                 The present invention relates to a method for treating B cell lymphoma. The method comprises administering at a first administration period, an immunologically active, mouse/human chimeric anti-CD20 antibody and/or administering, at a second administration period, a radiolabelled anti-CD20 antibody, to the human subject. The invention also discloses expression vectors that may be used in the method of the present invention. The method is useful for treating B cell lymphoma in humans. The present sequence represents murine anti-CD20 antibody light chain variable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antibody binding to CD20 and having Fc-bound sugar chains of low fucose content for treatment of cancer and immune disorders.
                                                                                                                                                                                                                                                                                                                             MDFQVQIISFLLISASVIMSRGQIVLSQSPAILSASPGEKVTWTCRASSSVSYIHWFQQK

The improvement comprises administering at least one chemotherapeutic agent. The antibody causes a substantial depletion of peripheral B cells. The antibody is chimeric anti-CD20 or C2B8. The method is useful for treating B cell lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                             PGSSPKPWIYATSNLASGVPVRFSGSGSGTSYSLTISRVEAEDAATYYCOOWTSNPPTFG 120
The invention relates to cells producing an antibody molecule specifically binding to CD20 are new, in which the antibody contains Neglecifically binding to CD20 are new, in which the antibody contains Neglecoside bond complex sugar chains bonded to the Region of the antibody peptide chains, of which less than 20% have a fucose residue bonded to the Neacetylgulcosamine residue at the reducing end of the sugar chain. The cells are used in the treatment and prevention of cancer and immune disorders. This sequence corresponds to a protein used in the
                                                                                                                                                                                                                                                                                              9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to cells with modified sugar chain modifying enzyme activity. The enzyme activity of binding the 1-position of fucose to the 6-position of an N-acety/glucosamine at the reducing end of a complex N-glycoside linked sugar chain via an alpha-bond is absent or less than in the parent cell. The sugar chain modifying enzyme is preferably alpha 1,6-fucosyltransferase (ADE73052-ADE73053 and ADE73055-ADE73056). The invention is useful for the treatment and prevention of tumours, allergy, inflammation, autoimmune disease, circulatory disorders, and viral and bacterial infection. The present sequence was used in an example from the invention.

The invention relates to a drug containing as the active ingredient, an antibody composition produced by cells tolerant to a lectin recognising a sugar-chain structure in which an alpha-bond is formed between the 6-position of N-acetylglucosamine at the reducing end of an N-glycoside bond-type complex sugar chain and the 1-position of fucose. The drugs are useful in screening and treating patients not suitable for drugs not preventives or remedies for diseases accompanying tumour, allersy or inflammation, autonimume diseases accompanying tumour, allersy or inflammation, autonimume diseases of the circulatory system, and viral or bacterial infections. In a method from the invention, a CCR4 gene was used for constructing a vector (CAG-CCR4/pcDNAs) for producing a transformant EL-4 cell (ATC TIB-39) to express chimeric CCR4. Antibody-dependent cytotoxicity of the thus produced antibody composition was confirmed. The current sequence represents a protein related to the

This invention relates to novel erythropoletin (EPO) peptides and the remodelling and glycoconjugation of these naturally occurring peptides thereof. Specifically, each BPO peptide comprises one or more glycans and has a glycoconjugation of these naturally occurring peptides that and glycoconjugate molecule such as polyethylene glycol (BEG) attached to it. Accordingly, the present invention provides glycoBGylated BPO peptides that have either monoantennary, biantennary or triantennary glycans covalently attached thereto. As such, these peptides are useful for the treatment of anaemia, and hence exhibit antianaemic activities working to increase hemanacorit levels in mammals, in particular in humans i.e. increasing the relative volume of blood occupied by erythrocytes. Purthermore, EPO therapy can be used to treat kidney callingation gatients. This polypeptide is a human protein sequence related invention.

peptide comprising poly(ethylene glycol). (MI) is useful for remodeling protein to generate glycopeptide having desired glycosylation pattern suitable for therapeutic use in mammal. (MI) is useful for remodeling peptides chosen from immunoglobulm, erythropotetin, tisue-type activator peptide, etc. (MI) is useful for remodeling (a) G-GSF which is useful for treating acute myeloid leukemia (AML), non-myeloid cancer patient receiving bone marrow transplant, (b) factor VII for treating bleeding episode, factor VIII deficiency, factor IX deficiency, liver cirrhosis, (c) FSH for patients undergoing intrauterine insemination, in vitro fertilization and for infertile patient, (d) EPO for treating anemic patient baving chronic renal insufficiency and end stage remain disease, anemic patient undergoing dialysis, (e) GM-CSF for treating acute myelogenous leukemia, (f) IFN-gamma for treating malignant osteoporosis, pulmonary fibrosis, tuberculosis, cryptococcal meningitis, etc. The glycopeptide produced using (MI) has specific customized or desired glycosylation pattern. (MI) allows efficient production of improved therapeutic moiety. The present sequence represents the amino acid sequence of a protein remodelled in the present invention

The invention describes a cert (1) that is neutralized to a security and a sugar chain modification, where fucose is linked by an activity at a sugar chain modification, where fucose is linked by an attenticipates in a sugar chain modification, where fucose is linked by an attenticipates in a sugar chain modification of Nacetylalucosamine at the reducing end of an N-glycoside-binding complex sugar chain. Also described are: a neutralization (M1) method of cell to the serum free medium by (M1); a cell having a knocked out genome gene encoding the enzyme which is involved in the carbohydrate modification that is neutralized to the serum free medium, by (M1); a cell having a knocked out genome gene encoding the enzyme which is nivolved in the carbohydrate modification that is neutralized to the serum free medium. Corpodydrate modification that is neutralized to the serum free medium.

(1) is useful for manufacturing a glycoprotein composition, which composition from the culture medium. The glycoprotein composition from the culture medium. The glycoprotein composition from the culture medium. The glycoprotein composition from the culture medium. The glycoprotein callsease such as cancer, inflammatory disease, autoimmune disease, autoimmune disease, allergy, circulatory disorder, virus or bacterial infection. This is the anibrand of producing glycoprotein compositions useful in drug discovery.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                 Domain deleted CC49 antibodies comprise a heavy chain human CC49 domain deleted sequence in which CH2 domain has been deleted and are reactive with tumour associated antigen (TAG) -72. The C2B8 antibodies are reactive with CD20 and comprise a heavy chain having a sequence of a derived domain deleted C2B8 construct where the CH2 domain has been deleted. Sequences of the invention are useful for imaging a neoplasm. They are also useful for treating myelosuppressed patients suffering from neoplastic disorder such as haematologic neoplasm, preferably non-Hodgkin's lymphoma. Antibodies of the invention are also used to treat neoplastic disorder, colon cancer and haematologic malignancy. They are useful for reducing tumour size, inhibiting tumour growth and/or useful for reducing the survival time of funour-bearing animals and for treating tumours. The present sequence is human C2B8 light chain protein. This sequence is used in the exemplification of the invention
                                           Novel domain deleted CC49 antibody reactive with tumor associated antigen -72, or C2B8 antibody reactive with CD20, useful for treating myelosuppressed patient suffering from a neoplastic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PGSSPKPWIYGTSTLASGVPTRFSGSGSGTSYSLTISRVEAEDAATYYCQQWSSNPFTFG 120

The invention relates to a dimeric antibody (1) comprising several monomeric subunits, where the monomeric subunits are non-covalently associated. (I) is useful for treating a disorder, especially immune disorder, and neoplastic disorder such as relapsed Hodgkin's disease, resistant Hodgkin's disease high grade, low grade and intermediate grade non-Hodgkin's lymphomas, B cell chronic lymphocytic leukemia (B-CLL), lymphoplasmacyroid lymphoma (LPL), mantle cell lymphoma (MCL), Gollicular lymphoma (FL), diffuse large cell lymphoma (DLCL), Burkitt's follicular lymphoma (PL), diffuse large cell lymphoma, angioimmunoblastic lymphoma and l cleaved cell, large cell immunoblastic lymphoma and l large cell, large cell immunoblastic lymphoma surkitt's and non-Burkitt's, follicular, mixed small cleaved and large cell lymphomas, in a mammal (see ABZ24017 for a

New non-naturally occurring single chain protein comprising polypeptides with binding domain, connecting regions and N-terminally truncated immunoglobulin, having immunological activity, useful for neutralizing infectious agent.

Disclosure; Page 383; 590pp; English

The invention relates to a non-naturally occurring single chain protein of capable of binding to a target molecule, the binding domain polypeptide comprising a heavy chain variable region, which comprises an amino acid cabable of binding to a target molecule, the binding domain polypeptide comprising a heavy chain variable region, which comprises an amino acid cabable of binding to a target molecule, the binding domain polypeptide comprising a connecting region attached to the first polypeptide comprising a connecting region attached to the first comprising a connecting region attached to the first comprising a connecting region attached to the first comprising a protein that is not not a subject (involved artached to the second protein of a protein or peptide that cather a protein that is less than 150 kp, which involves to the sound protein or peptide molecule are linked by a thred protein or peptide molecule is directly connected to the second protein or peptide molecule is directly connected to the second protein or peptide molecule is directly connected to the second protein or peptide molecule is directly connected to the second protein or peptide molecule is directly connected to the second protein or peptide molecule are linked by a third protein or peptide molecule are linked by a third protein or peptide molecule is not an antiabody, a member of the TWF family or the TWF receptor family, and is not conjugated with a bacterial toward or more compressing the polypeptide, axcressing the polypeptide of the compact of expressing the polypeptide, axcressing the polypeptide, axcressing the polypeptide of an animal), a polymulecide that encodes the polypeptide of the compact of expressing the polypeptide, axcressing the polypeptide of additional therapeuter comprising the polypeptide, axcressing the polypeptide or additional therapeuter comprising the polypeptide, axcressing the polypeptide or additional therapeuter comprising the polypeptide, axcressing the polypeptide or an animal, a damino and anormaturall the invention relates to a non-naturally occurring single chain protein
